Many of the neighborhoods with the highest number of cases per capita were among the first to receive coronavirus vaccines, a Times investigation found. The people living, work and worshiping there are much of Trump's base.

The outbreak is worse in areas with lower incomes ... ... and more people living together.

While age was a major factor in who died from Covid-19, neighborhoods with high concentrations of black and Latino residents, which are often poorer, were also hit hard by the death rates. In August, the city released the results of 1.2 million antibody tests, which showed that in any ZIP code in Queens, more than 30 percent of people who had been tested were found to have antibodies, a strikingly high rate.

The city has a long history of inequality, and the pandemic has only made it worse. Many of the city's poorest residents have lived hardest hit. The transition of the Covid-19 fight here passed from Cuomo to Mayor Bill de Blasio, who has struggled and has not addressed the underlying inequities that have driven the disparities in death rates.

Data for New York City includes confirmed cases and deaths from the city's Department of Health, which counts deaths by the location of each fatality. Data also includes individuals who did not have a confirmed test but were probable cases or confirmed deaths by the city's Department of Health and Mental Hygiene.

The New York Times has been collecting information from local health departments since the beginning of the pandemic. The numbers in this article are being updated several times a day based on the latest information our journalists are gathering from around the country.
